#### • The picture above is more astounding than it looks.

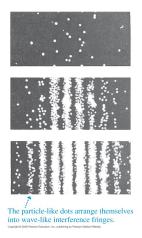

- The picture above is more astounding than it looks.
- If light was a wave, then taking a photo in very low light should produce a very dim version of the whole image. As the luminosity increases, we should see the photo get brighter.

 Acckkkk!!! We instead see the photo accumulate one dot at a time. As if light were a stream of particles and we were merely controlling the flow-rate.

- Acckkkk!!! We instead see the photo accumulate one dot at a time. As if light were a stream of particles and we were merely controlling the flow-rate.
- How do we reconcile this with our models of light??

 The double-slit experiment showed us that light is definitely wave-like....or is it?

- The double-slit experiment showed us that light is definitely wave-like....or is it?
- If we again go to the low intensity limit we should see dim versions of each of the constructive fringes.

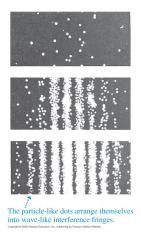

(4) (5) (4) (5)

- The light made interference patterns on the photograph.
- He reduced the intensity of the light and increased the exposure time repeatedly.
- Eventually the light was so dim that it took 3 months to get the pattern on the film. (He went sailing during the exposure.)
- He could prove that at this low light level there was never more than a single photon in the box at a time. Neverthless, an interference pattern was produced!

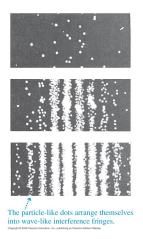

Neil Alberding (SFU Physics) Physics 121: Optics, Electricity & Magnetism

 Imagine doing the double slit experiment with light of such low intensity that only one photon passed through the slits at a time.

- Imagine doing the double slit experiment with light of such low intensity that only one photon passed through the slits at a time.
- If only one photon travels to the slits, it must pass through one or the other right?

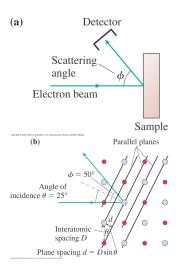

- Imagine doing the double slit experiment with light of such low intensity that only one photon passed through the slits at a time.
- If only one photon travels to the slits, it must pass through one or the other right?
- Wrong! The photons hit the screen one at a time and slowly build-up the "usual" interference pattern. Each photon "feels" the interference.

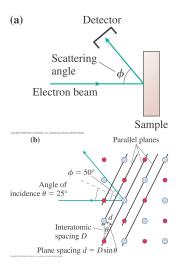

- Imagine doing the double slit experiment with light of such low intensity that only one photon passed through the slits at a time.
- If only one photon travels to the slits, it must pass through one or the other right?
- Wrong! The photons hit the screen one at a time and slowly build-up the "usual" interference pattern. Each photon "feels" the interference.

• Each photon travels through both slits....not at all like a particle.

• In 1927 Davisson and Germer studied electron-scattering.

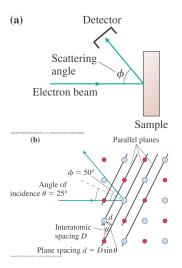

A (10) > A (10) > A (10)

- In 1927 Davisson and Germer studied electron-scattering.
- They scattered off of a piece of nickel and saw a set of minima and maxima which reminded them of X-ray scattering!!

**A b** 

(4) (5) (4) (5)

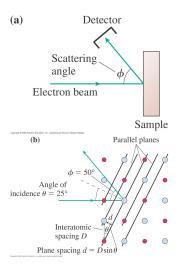

- In 1927 Davisson and Germer studied electron-scattering.
- They scattered off of a piece of nickel and saw a set of minima and maxima which reminded them of X-ray scattering!!
- They applied the equations from Bragg scattering to one of their peaks using the known atomic spacing for nickel and derived the "wavelength" of the electrons

$$\lambda = D \sin(2\theta) = 0.165$$
 nm

- In 1927 Davisson and Germer studied electron-scattering.
- They scattered off of a piece of nickel and saw a set of minima and maxima which reminded them of X-ray scattering!!
- They applied the equations from Bragg scattering to one of their peaks using the known atomic spacing for nickel and derived the "wavelength" of the electrons

 $\lambda = D \sin(2\theta) = 0.165 \text{ nm}$ 

• They could then use this "wavelength" to predict the position of all the other peaks...just as though they were scattering X-rays!!

• A graduate student named de Broglie had predicted this!

- A graduate student named de Broglie had predicted this!
- Einstein (1905) had shown that the energy of a photon is:

$$E_{photon} = hf = \frac{hc}{\lambda}$$

- A graduate student named de Broglie had predicted this!
- Einstein (1905) had shown that the energy of a photon is:

$$E_{photon} = hf = rac{hc}{\lambda}$$

 de Broglie wondered if matter obeyed the same sort of relationship between energy and frequency. But how do you define the "frequency" of matter?

< 回 > < 三 > < 三 >

- A graduate student named de Broglie had predicted this!
- Einstein (1905) had shown that the energy of a photon is:

$$E_{photon} = hf = rac{hc}{\lambda}$$

- de Broglie wondered if matter obeyed the same sort of relationship between energy and frequency. But how do you define the "frequency" of matter?
- He knew the kinetic energy of a particle was (classically)

$$\mathsf{E} = \frac{1}{2}m\mathsf{v}^2 = \frac{1}{2}m\left(\frac{p}{m}\right)^2 = \frac{p^2}{2m}$$

So, he could express energy in terms of momentum.

. . . . . . .

- A graduate student named de Broglie had predicted this!
- Einstein (1905) had shown that the energy of a photon is:

$$E_{photon} = hf = rac{hc}{\lambda}$$

- de Broglie wondered if matter obeyed the same sort of relationship between energy and frequency. But how do you define the "frequency" of matter?
- He knew the kinetic energy of a particle was (classically)

$$E = \frac{1}{2}mv^2 = \frac{1}{2}m\left(\frac{p}{m}\right)^2 = \frac{p^2}{2m}$$

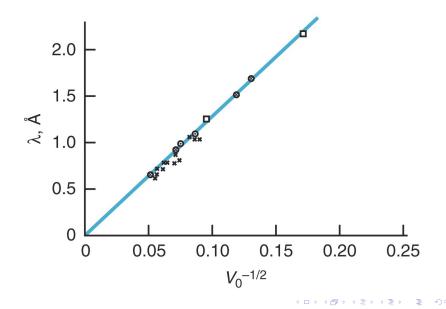

So, he could express energy in terms of momentum.

If he defined the wavelength of a particle as

$$\lambda = \frac{h}{p}$$

he could get something which worked in both models.

#### Davisson-Germer vs. Electron Energy

#### A Quote from Davisson:

We think we understand the regular reflection of light and X-rays - and we should understand the reflection of electrons as well if only electrons were waves instead of particles...

(4) (5) (4) (5)

4 A N

#### A Quote from Davisson:

We think we understand the regular reflection of light and X-rays - and we should understand the reflection of electrons as well if only electrons were waves instead of particles...It is rather as if one were to see a rabbit climbing a tree and were to say "Well, that is a rather strange thing for a rabbit to be doing, but after all it is really nothing to get excited about. Cats climb trees - so that if the rabbit were only a cat, we would understand its behaviour perfectly."

Physics 121: Optics, Electricity & Magnetism

Spring 2010 13 / 16

- We know that waves confined between two boundaries for a standing wave.
  What does that imply for matter confined to a box?
- (a) A classical particle of mass *m* bounces back and forth between the ends.

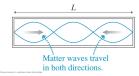

(b) Matter waves moving in opposite directions create standing waves.

(b) Matter waves moving in opposite directions create standing waves.

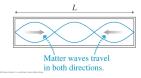

- We know that waves confined between two boundaries for a standing wave.
  What does that imply for matter confined to a box?
- If the matter wave becomes a standing wave we know

$$\lambda_n=\frac{2L}{n}, n=1,2,3,\ldots$$

(b) Matter waves moving in opposite directions create standing waves.

- We know that waves confined between two boundaries for a standing wave.
  What does that imply for matter confined to a box?
- If the matter wave becomes a standing wave we know

$$\lambda_n=\frac{2L}{n}, n=1,2,3,\ldots$$

 We also know that the particle has wavelength λ = h/p.

$$p_n = n\left(\frac{h}{2L}\right), n = 1, 2, 3, \dots$$

Neil Alberding (SFU Physics)

Physics 121: Optics, Electricity & Magnetism

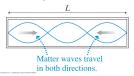

• We know that energy and momentum are related by  $E = p^2/2m$  giving

$$E_n = \frac{1}{2m} \left(\frac{hn}{2L}\right)^2 = \frac{h^2}{8mL^2} n^2, n = 1, 2, 3, \dots$$

(a) A classical particle of mass *m* bounces back and forth between the ends.

(b) Matter waves moving in opposite directions create standing waves.

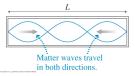

• We know that energy and momentum are related by  $E = p^2/2m$  giving

$$E_n = \frac{1}{2m} \left(\frac{hn}{2L}\right)^2 = \frac{h^2}{8mL^2} n^2, n = 1, 2, 3, \dots$$

- Particles in a box can only have certain allowed energies! This is the quantization of energy.

Now a purely corpuscular theory contains nothing that enables us to define a frequency; for this reason alone, therefore, we are compelled, in the case of light, to introduce the idea of a corpuscle and that of periodicity simultaneously. On the other hand, determination of the stable motion of electrons in the atom introduces integers, and up to this point the only phenomena involving integers in physics were those of interference and of normal modes of vibration. This fact suggested to me the idea that electrons too could not be considered simply as corpuscles, but that periodicity must be assigned to them also" - from Louis de Broglie's Nobel acceptance speech (1929)
